

Compounded Leuprolide Trigger Vials • 20 Units, 40 Units, 80 Units, 100 Units

This is a guide to injecting your Leuprolide Trigger Shot. Please make sure to follow your physician's or nurse's instructions carefully.

If you have any questions about your injection, please call Mandell's at 877-252-0553.

Figure 1. Your Leuprolide Trigger will contain a vial containing sufficient medication for your dose and a corresponding syringe.

Figure 2. After washing hands thoroughly, wipe the top of the vial with alcohol. Remove the orange cap from the syringe and insert the needle into the vial as shown.

Figure 3. Gently turn the vial upside down taking care to not create air bubbles. Draw up your dose as directed by your protocol. For example, if your dose is 40 Units, draw up to the "40" mark on the syringe, if the dose is 80 Units, draw up to the "80" mark, etc. Once you obtain the appropriate volume in your syringe, tap gently and remove any air bubbles from the syringe before injecting.

Subcutaneous Injection

Pinch and inject

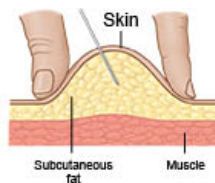

Figure 4. Once dose is ready, select your injection site and wipe the area with alcohol. Pinch the area as shown and insert needle under the skin at a 45-degree angle. Depress the plunger slowly to inject medication. After injecting, remove the needle and press and hold an alcohol swab to the area for about 20 seconds.
